# Step 1

We first replace  $X$  with an open neighborhood of the given smooth  $k$ -point  $x$ , i.e. we can assume  $X$  to be an integral scheme.

## Limits and morphisms of finite presentation

Let  $X$  be an integral  $k$ -variety, and let  $Y$  be an arbitrary  $k$ -variety.

The natural map

$$\{\text{rational maps } X \dashrightarrow Y\} \rightarrow Y(\mathbf{k}(X))$$

$$[\phi : U \rightarrow Y] \mapsto (\text{the composition } \text{Spec } \mathbf{k}(X) \hookrightarrow U \xrightarrow{\phi} Y)$$

is a bijection.

## Step 1

The given rational map  $X \dashrightarrow Y$  corresponds to a  $\mathbf{k}(X)$ -point of  $Y$ .

# Step 1.d

- $X$  is an integral scheme.
- $\mathbf{k}(X) = \text{Frac}(A)$ , for some affine open subset  $U = \text{Spec } A$ .
- The localization by a multiplicative set equals the direct limit of localization at each element of that multiplicative set

$$\text{Frac}(A) = \varinjlim_t A_t$$

where  $t \in A \setminus \{0\}$  with the order relation induced by divisibility.

- $A_t = \mathcal{O}_U(D(t))$  where  $D(t) = U \setminus V(tA)$  is a principal open subset of  $U$ , and  $A_i = \mathcal{O}_X(\text{Spec } A_i)$  where  $\text{Spec } A_i$  is dense affine open subscheme of  $X$

$$\varinjlim_i A_i = \mathbf{k}(X)$$

## Step 2

### Cohen structure theorem

Let  $X$  be a  $k$ -scheme of finite type, with  $x \in X(k)$  a regular point of  $X$ . Let  $\mathfrak{m}_x$  denote the maximal ideal of  $\mathcal{O}_{X,x}$  and  $\hat{\mathcal{O}}_{X,x}$  the  $\mathfrak{m}_x$ -adic completion of  $\mathcal{O}_{X,x}$ . Then we have an isomorphism of  $k$ -algebras

$$\hat{\mathcal{O}}_{X,x} \cong k[[t_1, \dots, t_d]]$$

where  $d = \dim \mathcal{O}_{X,x}$ .

### Step 2

The  $\mathbf{k}(X)$ -point of  $Y$  corresponds to a  $F$ -point of  $Y$ , where  $F$  is iterated Laurent series field. Since

$$\mathcal{O}_{X,x} \hookrightarrow \hat{\mathcal{O}}_{X,x} \cong k[[t_1, \dots, t_d]] \hookrightarrow F := k((t_1))((t_2)) \cdots ((t_d))$$

implies that  $\mathbf{k}(X) = \text{Frac}(\mathcal{O}_{X,x})$  is embedded in  $F$ .

Lang-Nishimura  
theorem

Gaurish Korpai

## Step 3

Statement

Theorem

Corollary

Proof

Overview

Step 1

Step 2

Step 3

Epilogue

Verifications

Applications

### Valuative criterion for properness

Let  $Y$  be a proper  $S$ -scheme. Then for any  $S$ -scheme  $\text{Spec } A$ , where  $A$  is a valuation ring with  $F = \text{Frac}(A)$ , the canonical map  $Y(A) \rightarrow Y(F)$  is bijective.

### Step 3 (applied $d$ times)

The  $F$ -point of  $Y$  extends to a  $A$ -point of  $Y$ , where  $F = k((t_1)) \cdots ((t_d))$  and  $A = k((t_1)) \cdots ((t_{d-1}))[[t_d]]$ .

The  $A$ -point of  $Y$  reduces modulo  $t_d$  to a  $K$ -point of  $Y$ , where  $t_d$  is a uniformizer of  $A$  and  $K = k((t_1)) \cdots ((t_{d-1})) = A/\langle t_d \rangle$  is the residue field such that  $A$ -model  $Y$  of  $Y_F = Y \times_{\text{Spec } k} \text{Spec } F$  reduces modulo  $t_d$  to the  $K$ -scheme  $Y_K = Y \times_{\text{Spec } k} \text{Spec } K$ .

THE UNIVERSITY  
OF ARIZONA

Lang-Nishimura  
theorem

Gaurish Korpai

## Step 3.a

Statement

Theorem

Corollary

Proof

Overview

Step 1

Step 2

Step 3

Epilogue

Verifications

Applications

- Consider the  $A$ -scheme  $Z = Y_A = Y \times_S \operatorname{Spec} A$ .
- Base change independence of the functor of points gives

$$Y(A) = Z(A)$$

- Similarly, for the  $F$ -scheme  $Z_F = Z \times_{\operatorname{Spec} A} \operatorname{Spec} F$

$$Y(F) = Z_F(F)$$

Thus it is sufficient to prove that the canonical map  $Z(A) \rightarrow Z_F(F)$  is bijective, where  $Z$  is a proper  $A$ -scheme.

THE UNIVERSITY  
OF ARIZONA

## Step 3.b

Lang-Nishimura  
theorem

Gaurish Korpai

Statement

Theorem

Corollary

Proof

Overview

Step 1

Step 2

Step 3

Epilogue

Verifications

Applications

- Let  $\alpha, \beta \in Z(A) = \text{Hom}_{\text{Spec } A}(\text{Spec } A, Z)$  be two distinct sections such that  $\alpha|_{\text{Spec } F} = \beta|_{\text{Spec } F} \in Z_F(F)$ .
- Note that  $\text{Spec } A$  is reduced and  $Z$  is separated  $A$ -scheme.
- $\text{Spec } F$  is dense in  $\text{Spec } A$  (generic point).
- Hence  $\alpha = \beta$  and the map  $Z(A) \rightarrow Z_F(F)$  is injective.

THE UNIVERSITY  
OF ARIZONA

## Step 3.c

Lang-Nishimura  
theorem

Gaurish Korpai

Statement

Theorem

Corollary

Proof

Overview

Step 1

Step 2

Step 3

Epilogue

Verifications

Applications

- Now we need to prove surjectivity of  $Z(A) \rightarrow Z_F(F)$ .
- Consider the section  $\sigma \in Z_F(F) = \text{Hom}_{\text{Spec } F}(\text{Spec } F, Z_F)$ .
- We wish to show that it can be extended to  $\tilde{\sigma} \in Z(A) = \text{Hom}_{\text{Spec } A}(\text{Spec } A, Z)$ .
- Since  $A$  is a valuation ring,  $\text{Spec } A$  has a generic point corresponding to the fraction field and a special point/closed point corresponding to the residue field (maximal ideal).

## Step 3.c.i

- Let  $\xi = \text{Spec } F$  be the generic point of  $\text{Spec } A$ .
- Then  $z = \sigma(\xi)$  represents an element of  $Z_F(F) = \{z \in Z_F \mid \mathbf{k}(z) = F\}$ .
- Let  $W = \overline{\{z\}} \subseteq Z$  be the closed subset endowed with the structure of a reduced (hence integral) subscheme.
- The canonical map  $W \rightarrow Z$  is a closed immersion.
- $W$  is a proper  $A$ -scheme since  $\pi : W \rightarrow Z \rightarrow \text{Spec } A$  is proper.
- The image of  $\pi : W \rightarrow \text{Spec } A$  is closed and contains  $\xi$

$$\pi(W) = \text{Spec } A$$

- $z$  is closed in  $Z_F$  and dense in  $W_F$

$$W_F = \{z\}$$

## Step 3.c.ii

- Let  $w \in W_K = W \times_{\operatorname{Spec} A} \operatorname{Spec} K \simeq \pi^{-1}(s)$  where  $K = A/\mathfrak{m} = \mathbf{k}(s)$  is the residue field at the closed point  $s$  of  $\operatorname{Spec} A$  corresponding to the maximal ideal of  $A$ .
- The local ring  $\mathcal{O}_{W,w}$  dominates the valuation ring  $A$  in the field  $\mathcal{O}_{W,z} = \mathbf{k}(W) = \operatorname{Frac}(A) = F$

$$\mathcal{O}_{W,w} = A$$

- The canonical map  $\operatorname{Spec} \mathcal{O}_{W,w} \rightarrow W$  with  $z$  in its image.
- $\tilde{\sigma} \in Z(A)$  defined as

$$\tilde{\sigma} : \operatorname{Spec} A = \operatorname{Spec} \mathcal{O}_{W,w} \rightarrow W \rightarrow Z$$

such that  $\tilde{\sigma}|_{\operatorname{Spec} F} = \sigma$ .

## $Y$ must be proper

Let  $X = \text{Proj } \mathbb{F}_2[x, y, z] / \langle y^2z - yz^2 + x^2z - x^3 \rangle$  be an elliptic curve. Then  $\#X(\mathbb{F}_2) = 5$ . Next, let  $Y = X \setminus X(\mathbb{F}_2)$ , which is not a projective curve, hence not proper. Then we have a rational map  $X \dashrightarrow Y$  defined by the identity morphism on  $Y$ , such that  $Y$  doesn't have a  $\mathbb{F}_2$ -point even though  $X$  has smooth  $\mathbb{F}_2$ -points.
